SUMMARY

Full stack engineer with 1.5+ years owning backend services on Node.js, MySQL, and Redis for a multi-tenant marketplace SaaS peaking at 9K requests/min and 60K database queries/min. Specialist in database performance, latency, and incident response. One of three final backend merge reviewers; open-source contributions merged upstream by go-ini, Microsoft Playwright, and Forgejo.

TECHNICAL SKILLS

Languages: Go (Golang), JavaScript, TypeScript, SQL, Java
Backend: Node.js, Express, REST APIs, microservices, concurrency, system design, unit testing
Frontend: Angular, Next.js, Svelte, HTML/CSS
Databases: MySQL (indexing, partitioning, sharding, replication), Redis, Elasticsearch, MongoDB, SQLite
Performance & Reliability: pprof, K6 load testing, Percona Toolkit, query optimization, incident response
Cloud & DevOps: AWS (EC2, S3, SES, IAM), Docker, Podman, Nginx, Cloudflare, CI/CD, Linux, Git

OPEN SOURCE CONTRIBUTIONS

- go-ini/ini** | merged & released in v1.67.3 — Go, 3.5K+ stars 2026
– **Cut heap allocations ~86%** in a foundational Go config library used by tens of thousands of projects by rewriting the hot path with lazy decoding; verified with pprof (**config-load CPU 27.8s to 2.1s**) and added a regression benchmark.
- Microsoft Playwright** | merged upstream — Docs/TypeScript, 93K+ stars 2026
– Documented an undocumented BFCache limitation that silently desynchronizes **Page** state on `goBack()/goForward()`; shipped across the guide, API reference, and generated client types.
- Forgejo** | merged upstream, backported to v15/v16 — JavaScript, 5.2K+ stars 2026
– Fixed a Firefox BFCache bug in the Git forge powering Codeberg that left forms stuck in a stale loading state after back-navigation; root-caused why it was untestable in CI by tracing Playwright's browser patches.

EXPERIENCE

- Jungleworks (Yelo)** Mohali, Punjab, India
Associate Software Engineer — Full Stack Jan 2025 – Present
- **Promoted from Trainee in 6 months**; one of three engineers with final merge authority on the backend, reviewing 200+ pull requests.
 - Patched a critical Next.js CVE ahead of other teams and led org-wide remediation across services.
 - **Eliminated a 6.8s table scan on a hot path** (to 5ms) through targeted indexing and cut read-replica slow queries by **70%**, clearing a 9-month partitioning backlog with zero-downtime schema migrations via Percona Toolkit.
 - Rewrote a crash-prone legacy API to eliminate cyclic data loops, dropping active MySQL connections from **1,200+ to 300–700** and improving **p95 latency from 76ms to 48ms** on a system peaking at **9K req/min and 60K DB queries/min**.
 - **Contained a distributed bot attack (120K+ fake accounts) within 15 minutes**, then shipped a K6-tested, Redis-backed multi-tenant rate limiter with real-time config and alerting the same day.
 - **Recovered commission revenue on ~42,000 transactions/month** going uncounted, by auditing billing logic and closing an expiration exploit.
 - Redirected a proposed MongoDB migration (~100M records total) after surfacing ID-type breakage and memory risks; designed the MySQL partitioning + rolling-retention alternative that met retention needs at lower cost.
 - Caught a **cross-tenant authorization vulnerability** (token replay in phone verification) during review; drove remediation with the upstream vendor and shipped an interim application-level mitigation.
 - Sole engineer on an end-to-end rewrite of a scheduling system (15 APIs, 9.2K LOC) with a zero-downtime cutover; also built transaction-safe order modification and Stripe orchestration (partial captures, holds, refunds).

PROJECTS

- Kosh — CLI Password Manager** | Go, Argon2id, ChaCha20-Poly1305, SQLite 2025
– Built an offline-first password manager with fully local encryption over an encrypted SQLite vault; designed a multiplicative fuzzy-search ranking algorithm with a Ctrl+R-style reverse-search UI, covered by a unit and regression test suite.
- PlutoLab Home Server** | Linux, Nginx, Podman, Cloudflare, Bash 2025
– Self-hosted a full infrastructure stack behind a zero-trust mTLS tunnel (Cloudflare edge to Nginx origin); built a polling-based CI/CD pipeline with atomic symlink swaps for zero-downtime deploys and instant rollback.

EDUCATION

- Panjab University, Chandigarh** — Master of Computer Applications (MCA), 83.04% May 2025
A.S. College, Khanna, Punjab — Bachelor of Computer Applications (BCA), 92.10% May 2023
